

Assessment Module 13 & 14 – Python (PostBoard)

Case Overview:

PostBoard is a terminal-based Python application where employees can log in, create posts, view all posts, and search posts by username.

Core Features:

1. User Login with validation
2. Create Post (Title, Description, Date)
3. View All Posts
4. Search Posts by Username

Data Structures Used:

- List – to store users and posts
- Dictionary – to store individual post details

Key Python Concepts:

- Functions for modular design
- Loops (for, while)
- Input/Output formatting
- datetime module
- Basic validation

Conclusion:

This application demonstrates the fundamentals of Python programming including collections, functions, loops, and modular structure without using a database.
